

The ultimate protection for your home and office

Tips for your peace of mind

Don't lose your signal

Your electronic security system relies upon your telephone lines to report a burglary, fire or other event. This vital communication to your central station is not 100% reliable.

Today's cellular technology provides additional protection. When an emergency arises in your household or business you can ensure that critical information will reach our central station, even if telephone lines are disabled or interrupted. That's real peace of mind.

Even more of a concern, many alarm subscribers are not aware that:

- ***The new digital phone service using voice over internet protocol (VoIP) technology may not be compatible with the signals being sent by your alarm. Problems can also occur with DSL high speed lines.***
- ***If you disconnect your landline phones and replace them with mobile cellular service, your alarm system must be reconfigured to send signals to the monitoring station.***

If you have made any such changes to your home/business telephone lines, it is important that you verify the alarm system's ability to communicate with the central station.

Our cellular backup service can solve all these potential problems. This technology ensures that your security system can send alarms... no matter what, even when there is NO PHONE LINE.

Add cellular backup today – All you'll need is a transceiver and a low monthly service fee. Please call. Let us enhance your security and your peace of mind.

YOUR SECURITY IS OUR BUSINESS.
